

REVENUE GROWTH MANAGEMENT

Acme Corp — Revenue Growth Management & Pricing Architecture

Five NRM levers and a quantified prize for FY26, forward to FY27

Document type Revenue growth management plan

Period FY2026 · forward to FY27

Owner RGM Lead; CFO office

Prepared July 2026

Total FY25 trade spend	\$146.7M across the portfolio
Heaviest line	Crunchwell ~25.6% of gross, 0.57 incrementality
Retail-media return	\$0.65 incremental per \$1 (Amazon 0.40 drags)
Pricing gap widening	Crunchwell→Field & Honey 8% → 14%
Whitespace concept	Crunchwell Mega Family Pack 36oz — \$8.5M
The prize (benchmark)	RGM typically worth 3–5% of gross profit / yr

Executive summary

Acme spends roughly \$146M a year in trade and another ~\$4M a quarter in retail media, and it is not spending either efficiently. Crunchwell's trade runs at ~25.6% of gross for a 0.57 incrementality index; retail media returns \$0.65 incremental per dollar, dragged by Amazon Ads at 0.40. That inefficiency is the opportunity. This plan lays out the five revenue-growth-management levers — pricing, promotion, price-pack architecture, trade terms, and mix — each with a specific, data-grounded action for FY26 and a line to FY27. Against an industry benchmark that RGM analytics are typically worth 3–5% of gross profit a year, the levers here are how Acme funds roughly half of its 16%-by-FY28 margin commitment.

- **Pricing:** the Crunchwell-to-Field&Honey; price gap has widened from 8% to 14%; elasticities differ sharply by SKU (Crunchwell Mega –1.84 to –2.12; ProteinPeak –0.92 to –1.18), so pricing must be surgical, not across-the-board.
- **Promotion:** Crunchwell trades at ~25.6% of gross for only 0.57 incrementality — the largest single efficiency prize in the portfolio; Q1 FY26 events ran a 0.52 incrementality index.
- **Price-pack architecture:** the Crunchwell Mega Family Pack 36oz (\$8.5M concept) is priced whitespace that trades pantry-loaders up rather than discounting the existing pack.
- **Trade terms & mix:** shift terms toward incrementality-based funding, and let mix do the work — every point of volume that moves to Wellness Protein is higher-margin than the Family-Sweet point it replaces.

1 · The prize, and why it's here

FY25 TRADE SPEND	CRUNCHWELL TRADE RATE	RETAIL-MEDIA ROI	Q1 PROMO INCR. INDEX	BENCHMARK PRIZE
\$146.7M portfolio total	~25.6% of gross · 0.57 incr	\$0.65 incremental per \$1	0.52 43 events, \$11.6M	3–5% of gross profit / yr

Revenue growth management is not a pricing exercise; it is the discipline of extracting more gross profit from the same volume by managing five levers together. Acme has a large prize because it currently manages them loosely: ~\$146M of annual trade at a portfolio incrementality below 0.6, and a retail-media portfolio returning \$0.65 on the dollar. Industry benchmarks put well-run RGM at **3–5% of gross profit per year** (cited as an industry benchmark, not an Acme measurement). On Acme's base that is the larger part of the ~\$17M of structural profit the 16%-by-FY28 margin commitment requires (see the Long-Range Plan, Report 15).

2 · Lever 1 — Pricing architecture

Pricing must be surgical because elasticity is not uniform. The elasticity estimates below (log-log MMM, high-confidence SKUs) show Crunchwell's Mega packs are the most price-sensitive in the portfolio (–1.84 to –2.12 — pantry-loadable, easy to over-discount), while ProteinPeak's premium SKUs are the least (–0.92 to –1.18). The strategic implication: take price where the shopper is inelastic (ProteinPeak, premium granola) and hold or protect price where they are not, rather than a portfolio-wide list move.

Crunchwell Mega is the most elastic (protect price / avoid deep discounting); ProteinPeak premium is the least (headroom to take price).

Source: seed_sku_elasticity_estimates (log-log MMM, confidence ≥ 0.60; most-elastic estimate per SKU).

The widening price gap

The Crunchwell-to-Field&Honey; price gap has widened from ~8% to ~14%. On elastic Crunchwell packs that gap invites trade-down at exactly the moment Larksfield is escalating in the South. The pricing lever is not “raise price” — it is close the gap surgically on the elastic packs while taking headroom on the inelastic premium tier.

3 · Lever 2 — Promotion efficiency

Promotion is where the biggest, most immediate dollars sit. Crunchwell alone spent ~\$92.4M in FY25 trade at ~27% depth for a 0.57 incrementality index — meaning a large share of promoted volume would have sold anyway. The portfolio pattern below shows the prize concentrates in the two heaviest, lowest-incrementality lines (Crunchwell, HoneyNest). Q1 FY26 events ran 43 promotions, \$11.6M spend, at a 0.52 incrementality index and 14.3% average lift — confirming the structural inefficiency is still live.

3.1 · FY25 trade by brand — spend, depth, incrementality

Brand	Trade spend	Avg depth	Incr. index	RGM call
Crunchwell	\$92.4M	27.3%	0.59	Rework — heavy & low incr.
HoneyNest	\$21.7M	24.4%	0.51	Rework — heavy & low incr.
TrailGrove	\$10.8M	13.7%	0.52	Trim depth
MorningOats	\$10.2M	18.0%	0.58	Efficient
ProteinPeak	\$6.9M	11.9%	0.45	Trim depth
RootDay	\$4.7M	9.5%	0.42	Trim depth
Total portfolio	\$146.7M	—	~0.55	Shift to incrementality funding

Source: seed_trade_spend_fy25 (spend-weighted depth & incrementality). Total ~\$146.7M.

Trade incrementality index by brand (>1.0 = fully incremental)

No brand's trade is fully incremental; RootDay (0.42) and ProteinPeak (0.45) are the weakest, Crunchwell (0.59) the largest absolute prize by spend.

Source: seed_trade_spend_fy25, spend-weighted incrementality index by brand.

The relationship is the whole argument: deeper promotions do not buy more incrementality. Crunchwell and HoneyNest run the deepest discounts (24–27%) yet sit mid-pack on incrementality (0.51–0.59), while shallow-depth ProteinPeak (11.9%) and RootDay (9.5%) are the least incremental for different reasons — small base, wrong mechanic. The lever is to trade depth for frequency-and-quality on the heavy lines, not to promote more.

Promo depth vs incrementality — deeper is not more incremental

Depth and incrementality are decoupled — the case for reworking mechanics rather than cutting or deepening spend. Incrementality shown indexed (×30) for scale.

Source: seed_trade_spend_fy25, spend-weighted by brand. Incrementality scaled ×30 for comparability.

4 · Levers 3–5 — Price-pack, trade terms, mix

4.1 · Lever 3 — Price-pack architecture

Price-pack architecture creates value by giving the shopper a reason to trade up rather than a reason to wait for a deal. The clearest whitespace is the **Crunchwell Mega Family Pack 36oz** — an \$8.5M year-one concept (Stage-3 prototype, 0.62 confidence, planned FY27). A larger pack at a value price-per-ounce captures the pantry-loading Mega shopper who is otherwise the most price-elastic (–1.84 to –2.12) and most likely to buy only on deep promotion. It converts a promotion-dependent buyer into a bigger, full-margin basket. Single-serve formats (MorningOats cups, +9.8%) are the second architecture prize.

4.2 · Lever 4 — Trade terms

Trade terms should pay for incrementality, not display. Today's terms fund depth and frequency loosely; the FY26–FY27 move is to tie a growing share of trade funding to modelled incrementality and to pay-for-performance mechanics, starting with the heaviest, lowest-incrementality lines (Crunchwell, HoneyNest). The retail-media portfolio is the proof of concept: Walmart Connect returns 1.20 incremental per dollar and Amazon Ads only 0.40, so the same logic — fund what is incremental — reallocates ~\$700K out of Amazon in H2 (see Report 16 and the trade PEA, Report 27).

4.3 · Lever 5 — Mix

Mix is the quiet lever and, over the plan horizon, the largest. Every point of volume that shifts from Family Sweet (+1.4% category, mature margin) to Wellness Protein (+18.3% category, premium margin) improves the blended gross margin without any pricing action at all. The ProteinPeak build in the Long-Range Plan (Report 15) is therefore also an RGM lever: it grows revenue and lifts margin mix simultaneously. Managing mix means protecting the premium price-points that make the shift accretive rather than trading them away in promotion.

Retail-media incrementality — the model for trade terms

Q1 FY26 retail media returned \$0.65 incremental per \$1: Walmart Connect 1.20 and Kroger Precision 0.77 carry the portfolio, Amazon Ads 0.40 drags it. Paying for modelled incrementality rather than platform-reported ROAS is exactly the terms discipline this plan extends to trade.

5 · Lever-by-lever action plan & the quantified prize

The five levers resolve to a single operating rhythm with a quantified prize. The prize band below uses the industry RGM benchmark (3–5% of gross profit) applied directionally to Acme's spend base; it is a planning estimate, not a measured Acme result.

Lever	FY26–FY27 action	Owner	When
Pricing	Close Crunchwell→F&H; gap surgically; take headroom on inelastic premium	RGM Lead	FY26 H2 → FY27
Promotion	Rework Crunchwell/HoneyNest mechanics; trade depth for quality; incrementality-fund	RGM / Trade	FY26 H2
Price-pack	Launch Crunchwell Mega Family Pack 36oz (\$8.5M concept); scale single-serve	Priya Raman	FY27-Q1

Lever	FY26–FY27 action	Owner	When
Trade terms	Tie a growing share of funding to modelled incrementality; pay-for-performance	CFO office / Trade	FY27 terms cycle
Mix	Accelerate Wellness-Protein shift; protect premium price-points	Sage Park / RGM	FY26 → FY29

Source: Levers grounded in seed_trade_spend_fy25, seed_sku_elasticity_estimates, seed_retail_media_spend_q1_2026, seed_innovation_pipeline.

The prize, sized and caveated

At the industry benchmark of 3–5% of gross profit per year, disciplined RGM is worth a material, multi-million-dollar structural gain on Acme's ~\$146M trade and retail-media base — the larger share of the ~\$17M of profit the 16%-by-FY28 margin commitment needs. This is an industry benchmark applied as a planning estimate, not a measured Acme result; the CFO effectiveness read (Report 40) tracks realised capture.

6 · Risks to capture

What erodes the prize

(1) Reflexive depth response to Larksfield's promo intensity re-inflates Crunchwell trade before mechanics are reworked. (2) Pricing headroom on premium is competed away if ProteinPeak loses the innovation edge. (3) Trade-terms change meets retailer resistance at the FY27 terms cycle — start with the cat-captain accounts where Acme has leverage (Kroger).

Recommendations & next steps

#	Action	Owner	When
1	Rework Crunchwell and HoneyNest promo mechanics — trade depth for quality; fund on incrementality.	RGM Lead / Trade	FY26 H2
2	Close the Crunchwell→Field&Honey; price gap surgically on elastic packs; take premium headroom.	RGM Lead	FY26 H2 → FY27
3	Advance the Crunchwell Mega Family Pack 36oz price-pack concept to launch (\$8.5M year-one).	Priya Raman	FY27-Q1
4	Shift trade terms toward modelled-incrementality funding, starting with cat-captain accounts.	CFO office / Trade	FY27 terms cycle
5	Track realised RGM capture against the 3–5% benchmark in the CFO effectiveness read (Report 40).	CFO office	Quarterly
