Acme Corp — H1 FY2026 Shopper & Household Panel Insights Review

Kantar cohort penetration, source of volume, and the demographics behind the ProteinPeak launch

Document type Shopper & panel insights review

Period H1 FY2026

Owner Consumer Insights; Panel Analytics

Prepared July 2026

Panel frame	Kantar Worldpanel, FY25Q1 → FY26Q2 (US-NAT)
Eroding cohort	loyal-family 47.9% → 46.6% penetration
Growing (good)	protein-returner 11.5% → 13.1%
Growing (risk)	cereal-skipper 18.3% → 20.8%
Launch source of volume	53% new-to-brand · 32% cannibalization · 15% competitor

Executive summary

The household panel tells a two-speed story. The buyer base for legacy family cereal is slowly eroding — the loyal-family cohort's penetration slipped from 47.9% to 46.6% over six quarters, and the cereal-skipper cohort grew from 18.3% to 20.8%, the single most important risk signal in the frame. Against that, the protein-returner cohort grew from 11.5% to 13.1% and buys ~4.6 times a quarter, and the ProteinPeak launch drew 53% of its real volume from genuinely new-to-brand households. The franchise is not collapsing; it is being slowly re-based toward protein and convenience while the sweet-cereal occasion thins out.

- **Cohorts (US-NAT, FY25Q1 → FY26Q2):** loyal-family 47.9 → 46.6 (eroding); protein-returner 11.5 → 13.1 (growing, valuable); cereal-skipper 18.3 → 20.8 (growing — the risk); price-shopper 22.2 → 22.8 (stable).
- **Source of volume:** of ProteinPeak's real switching households, 53% were new-to-brand (431), 32% cannibalization from other Acme (260), 15% competitor switch (125) — a healthy, franchise-accretive split.
- **The occasion risk:** the cereal-skipper cohort growing to one in five households, amplified by the GLP-1 appetite shift, is a slow structural drain on the breakfast occasion that no single launch reverses.
- **Who bought the launch:** ProteinPeak buyers skew high-income (150K+ the largest bracket) but with a broad income spread, and over-index on multi-brand switchers — the profile you want for a franchise-building launch.

1 · Cohort penetration — who is in the category

LOYAL-FAMILY	PROTEIN-RETURNER	CEREAL-SKIPPER	PRICE-SHOPPER
46.6%	13.1%	20.8%	22.8%
↓ from 47.9%	↑ from 11.5%	↑ from 18.3% (risk)	≈ flat

Four cohorts, six quarters. Loyal-family drifts down; protein-returner and cereal-skipper both climb.

Read the lines as competing pulls on the same households. The loyal-family cohort — the spine of Crunchwell and HoneyNest volume — has lost ~1.3 points of penetration in six quarters. That volume is not vanishing so much as splitting two ways: some of it into the protein-returner cohort (up +1.6 points, and a heavy buyer at 4.6 trips/quarter), which ProteinPeak is built to capture, and some of it out of the category entirely into the

cereal-skipper cohort (up +2.5 points). The cereal-skipper line is the one to watch — it is the panel signature of the GLP-1 appetite shift and the broader breakfast-occasion decline.

The cereal-skipper cohort is the structural risk

One in five US households is now a cereal-skipper (20.8%, up from 18.3%). These are lapsing occasions, not lapsing brands — no promotion or pack refresh wins them back because they are leaving the breakfast-cereal aisle, not switching within it. The portfolio answer is convenience and protein formats that fit a smaller-portion, on-the-go occasion, not deeper trade on legacy sweet cereal.

2 · Source of volume — where ProteinPeak's launch volume came from

The household-transaction panel resolves the launch into three kinds of switch. Of the 816 households whose ProteinPeak purchase was a genuine switch, 431 (53%) were new-to-brand, 260 (32%) came from another Acme brand (cannibalization), and 125 (15%) switched in from a competitor. A launch that is majority new-to-brand with only ~a third cannibalization is franchise-accretive — it is growing the Acme buyer base, not just reshuffling it (see the Week-4 read, Report 23).

ProteinPeak source of volume (real switches, PP005+PP006)

53% new-to-brand is the headline: this launch expands the franchise more than it shifts it.

2.1 · Switching by brand-loyalty segment

Loyalty segment	New-to-brand	Cannibalization	Competitor switch
Multi-Brand Switcher	185	124	50
Acme Loyal	108	63	33
Competitor Loyal	82	38	21
Light Buyer	56	35	21

Source: household_transactions, Switching_Flag, PP005 + PP006 (ProteinPeak launch SKUs).

Multi-brand switchers supplied the largest block of new-to-brand households, which is exactly the profile a protein launch should attract — mobile shoppers with no fixed cereal loyalty. Encouragingly, a meaningful share of new-to-brand volume also came from competitor-loyal and light-buyer households, evidence the launch is

pulling genuinely incremental buyers rather than only churning within the Acme base.

3 · Who the launch buyer is

Buyer income skews to the 150K+ bracket but spreads broadly — a premium proposition with mass reach.

ProteinPeak's launch buyers skew premium — the 150K+ bracket is the single largest — but the distribution is broad rather than concentrated, so the proposition is not confined to a high-income niche. By ethnicity, the buyer base broadly mirrors the household panel, with a meaningful Hispanic sub-base that connects to the Hispanic-format innovation thesis (Crunchwell Maiz Crunch, Report 33). The households table also confirms a category-wide skew toward multi-brand switchers over single-brand loyalists — a category where habit is loosening and a well-positioned launch can take share.

3.1 · Launch-buyer ethnicity mix

Ethnicity	Buyer households
Non-Hispanic White	519
Hispanic	150
Non-Hispanic Black	88
Asian	54
Other	36

Source: household_transactions + households (Kantar-shape panel), PP005 + PP006 buyers.

4 · The breakfast occasion under GLP-1

The single biggest medium-term threat in the panel is not a competitor — it is the shrinking breakfast-cereal occasion. The GLP-1 / Ozempic appetite shift (macro strength 0.81, flagged as a down-volume force) reduces portion size and eating frequency, and it lands hardest on the largest, sweetest bowls. The panel signature is the cereal-skipper cohort's climb to 20.8% penetration. This is why the portfolio's forward bet is weighted toward protein (satiety, permissibility) and single-serve (portion-controlled, on-the-go) rather than toward defending legacy family-sweet volume.

Panel-to-shelf reconciliation

These are Kantar-shape household-panel measures (who bought, how often). They will not tie to the NielsenIQ retail-dollar view in the category report (Report 30) to the decimal — different instruments, same direction. Both show protein gaining and legacy sweet losing. Cohort penetration here is the US-NAT panel cut; regional cuts (LA-DMA, Southeast) move faster and are tracked separately.

Recommendations & next steps

#	Action	Owner	When
1	Weight portfolio and media behind protein and single-serve to meet the GLP-1 / cereal-skipper occasion shift, not deeper trade on legacy sweet.	Consumer Insights	FY27 planning
2	Protect the ProteinPeak launch's new-to-brand momentum with sustained repeat-driving media, not just trial support.	Sage Park	H2 FY26
3	Size the Hispanic sub-base opportunity to inform the Crunchwell Maiz Crunch concept (Report 33).	Panel Analytics	FY27 planning
4	Instrument a quarterly cereal-skipper win-back test focused on convenience formats.	Consumer Insights	H2 FY26
